

## Industrial Oil Analysis Program

**Lubricant Analysis Programs are designed to increase asset reliability and also achieve the maximum use of lubricants.**

Oil analysis is similar to a routine blood test. By looking at a blood sample, a physician can determine the overall health of the individual. The same can be said for oil analysis. The analysis results provide you with information about the overall health of the equipment being tested.

Our oil analysis program will provide you with accurate data which will help determine the condition of the oil and the equipment along with recommended actions to ensure your equipment is running correctly. Through routine analysis we are able to monitor the oil for mechanical, operational and environmental factors which can affect the life of the equipment and the oil in it.

***Industry experts generally agree that between 40% and 75% of all wear in industrial equipment is in some way related to lubrication.***

An oil analysis program can save your company money through:

- Less consumption of lubricants with extending oil drain intervals
- Less parts to inventory
- Less lubricant disposal
- Less labor
- Less on insurance premiums
- Most importantly...Less downtime

**Preventing unexpected downtime these days is a necessary step all companies need to take to ensure that can stay competitive in their respective marketplace.**

**For Oil Sample Kits and Supplies Contact your local Sunbelt Sales Representative or call (800)621-7508**
